LegalEase

Breaking barriers between legal languages and everyday life.

Introduction

In a world where hundreds of people stand in lines outside courts and legal advisors' cabins, LegalEase is built to make life easier and reduce the time being wasted wondering if we will be brought to justice or not.

Name of Project:
LegalEase

Presented By:
Aaqilah, Chitra, Pooja, Shreesha and Sharvesh

Presented To:
Dr. Meenakshi and Ms. Nivitha

Vision & Mission Of LegalEase.

To simplify legal documents, Highlight the clauses that actually matter, Detect what's missing, Educate users on their basic rights and Reduce the time and cost of legal review.

Vision

Legal literacy should not be a privilege. It should be a basic digital right for every citizen.

Mission

To save the masses from contemplating if their issues are valid by providing information from the comfort of their home.

Our long term vision extends this further: to connect users not only to the text of their own document, but to the broader framework of trusted legal knowledge that governs their rights in the first place.

Database and Tech

At the very foundation of our knowledge base sits the Constitution of India, the supreme legal document of our country, and the source from which every citizen's fundamental rights flow.

Alongside the Constitution, our knowledge layer references other trusted legal instruments, relevant Acts, statutory regulations, and established legal definitions

Database	Frontend	Backend
MySQL	HTML, CSS	Python

Workflow

The final output the user receives is threefold: a highlighted view of their original document showing exactly where the risk lies, a clause-by-clause explanation in plain language, and a downloadable PDF report summarizing everything, complete with suggested next steps

Upload

The user simply uploads their document — a PDF or a DOCX

Text Extraction

Behind the scenes, our system uses OCR and structured parsing to pull clean, organized text out of the document.

Clause Detection

Our NLP models scan the extracted text and identify the type of each clause — liability, indemnity, termination, penalty, renewal, confidentiality, and more

Risk and Summary Generation

for every clause, the system generates a concise, human readable explanation, not legal jargon rephrased, but genuinely plain language a person with no legal background can understand in one read.

System Modules

Security Features

RBAC

RBAC controls what a user is allowed to do based on their role.

TLS/SSL Encryption in Transit

This protects data while it is traveling between the user and server.

Malware & Virus Scanning Engine

Whenever someone uploads a document, the system scans it for malicious content

Data Isolation & Sandboxing

Each user's data is logically separated. The backend enforces this at the database/application level.

System Modules

Technical Modules

RESTful API

REST APIs allow the frontend and backend to communicate.

OCR Pipeline

OCR converts the image into machine-readable text

NLP Engine

This module uses AI to understand text in legal documents.

MySQL Relational Database

MySQL stores the structured information used by the application.
